## BALANCING ACT!

Use the molecular model kits provided to help you balance the following unbalanced equations. First "build" the reactants and the products. Use the arrow to separate the two. Then make sure that the equation doesn't violate the *Conservation of Mass*, i.e. make sure each element is present in the same number on both sides of the equation. Then write the balanced equation.

**Remember! You can change the number of each molecule, but you can't change the molecule itself!**
